

Investment Sizing India's 2070 Net-Zero Target

Vaibhav Pratap Singh and Gagan Sidhu

Issue Brief | November 2021

Executive summary

On 1 November 2021, India's Prime Minister declared that India would achieve net-zero emissions by 2070. The announcement made at COP26 in Glasgow was in tandem with a declaration of an enhancement of India's Paris commitments. Achieving net-zero involves technology pathways as well as financial flows. These finance flows, or investments, are required to fund the construction of the associated physical infrastructure (**total investment**). In India's case, such investments will run into trillions of dollars. The investment requirement curve would have been steeper if the time taken to reach net-zero was to be reduced further. The mobilisation of investments to achieve net-zero

expectedly will be sourced from domestic banks, Non-Banking Finance Companies (NBFC), and debt capital markets, both domestic and international. However, a gap remains (**investment gap**) between the total investment required to achieve net-zero and the amount that can be reasonably mustered from conventional sources.

Along with the sectoral deployment of different technologies, India's net-zero commitment will require immense capital investment in infrastructure.

	Total investment		Investm	ient gap	Investment support		
	Aggregate from 2020 till the respective net-zero year	Average annual from 2020 till the respective net-zero year	Aggregate from 2020 till the respective net-zero year	Average annual from 2020 till the respective net-zero year	Aggregate from 2020 till the respective net-zero year	Average annual from 2020 till the respective net-zero year	
2040 peak - 2070 net-zero	10,103	202	3,546	71	1,419	28	
2030 peak - 2060 net-zero	8,266	207	4,181	105	1,672	42	
2030 peak - 2050 net-zero	5,724	191	3,407	114	1,363	45	

Table 1 Total investment, gap, and support for India's net-zero target scenarios

Source: CEEW-CEF analysis

Note: Amounts in constant 2020 USD billion

Bridging this gap requires investment from overseas, which may be sought on concessional terms. For purposes of this brief, we assume the concession to be the cost of hedging, irrespective of whether the capital flows as equity or debt¹. The value of the concession represents the real value of external investment support (investment support) required for achieving netzero. In table 1, we size these three investment types for three net-zero scenarios for India, including the declared 2070 target. Specifically, the total investment estimated pertains to electricity (generation, integration, transmission, and distribution), hydrogen (production), and vehicles (manufacturing). We find that the aggregate investment support required by India to achieve its 2070 net-zero target will be USD 1.4 trillion at an average of USD 28 billion per year.

To mobilise USD 10.1 trillion of investments and bridge the investment gap of USD 3.5 trillion, under the 2070 net-zero pathway, India would need investment support worth USD 1.4 trillion until 2070. This investment support amount equates to an average annual value of USD 28 billion over the next 50 years, varying from USD 8 billion annually in the first decade, to USD 42 billion annually in the fifth decade.

Currency hedge is a kind of insurance against unfavourable movements in exchange rates between the capital source and deployment country. The cost of this insurance refers to the cost of hedging. We have considered the hedging cost as the value of investment support required to attract private capital to the identified sector beyond the conventional sources.

	2040 peak - 2070 net-zero		2040 peak -2	060 net-zero	2030 peak -2050 net-zero		
	Aggregate	Average annual	Aggregate	Average annual	Aggregate	Average annual	
2020-30 (decade 1)	82	8	85	9	90	9	
2030-40 (decade 2)	122	12	405	40	471	47	
2040-50 (decade 3)	352	35	547	55	801	80	
2050-60 (decade 4)	442	44	635	64	-	-	
2060-70 (decade 5)	420	42	-	-	-	-	
Aggregate from 2020 till the respective net-zero year	1,419		1,672	-	1,363	-	
Average annual from 2020 till the respective net-zero year	-	28	-	42	-	45	

Table 2 Investment gap per decade for India's 2070 net-zero target

Source: CEEW-CEF analysis

Note: Amounts in constant 2020 USD billion

However, as table 2 demonstrates, the decadal investment support requirements are not flat but rather increase significantly as we near respective net-zero years. Had India chosen a 2050 net-zero target year, the average annual investment support requirements in decades two and three (USD 47bn and USD 80bn respectively) would have been 3.9x and 2.3x the corresponding values for the 2070 target year selected.

1. Introduction

Developing countries looking beyond conventional means to secure investments could look for support beyond their borders. They have long demanded that developed nations increase commitments towards climate finance. A number of developed nations have responded by enhancing climate finance pledges in the months leading up to COP26 and during the conference (UNCCC UK. 2021). The hope on this front is a further increase in ambition beyond the USD 100 billion and that actual flows eventually match the promises made. Further, the finalisation of the implementation guidelines relating to carbon markets under Article 6 at COP26, including the settlement of the long-standing issue of the transition of certified emission reductions (CERs) from the Kyoto Protocol regime (Dutt, Arjun. 2021), potentially offers new possibilities for channelling investment flows.

But the biggest promise lies in the USD 130 trillion in collective assets managed by banks, insurers, asset managers, and asset owners, all of whom have committed to achieve net-zero emissions by 2050 and stay on a 1.5°C pathway (UNEP,2021 and GFANZ,2021). This is an unprecedented opportunity for India's excellent long-term policy certainty, and zero emission investment needs to match the tsunami of capital committed to global decarbonisation opportunities.

So what explains the appeal of net-zero targets? What would achieving them for a country like India would entail?

Net-zero commitments by developing countries will require international banks, insurers, asset managers managing USD 130 trillion in collective assets to deliver on their pledges. Investment support measures can play a critical role in ensuring this capital flows as required.

2. Net-zero's appeal

Net-zero's appeal lies in its simplicity. It means gross emissions are matched by carbon sinks that can fully absorb them. These can be natural sinks, such as forests or soil carbon sequestration. They can also be manmade and achieved through technologies such as carbon capture and storage (CCS)—although almost no progress has been made to date on CCS despite two decades of promises from the fossil fuel industry (IEA,2020). In effect, net-zero does away with the subjective parameters in various NDCs, such as the choice of base year or the choice between reductions in total emissions and reductions in emissions intensity. It simplifies the debate around emissions using a common yardstick.

Even so, two questions remain. First, what does netzero look like? Second, how much investment does it require? Both are vital to understanding the one variable in an otherwise uniform yardstick: the year by which a country can reasonably hope to achieve netzero. However, to assess the feasibility of any net-zero target year, it is critical to fully appreciate the physical infrastructure needed as well as the associated financial requirements.

3. What does net-zero look like?

On 12 October 2021, CEEW released a working paper titled *Implications of a Net-Zero Target for India's Sectoral Energy Transitions and Climate Policy* (Chaturvedi, Vaibhav, and Ankur Malyan. 2021). It uses the Global Change Analysis Model (GCAM, CEEW version) to generate sixteen sectoral pathways, or scenarios, under which India could achieve net-zero. It then evaluates these scenarios against a reference scenario. Each scenario is a distinct combination of two variables: the choice of peaking and net-zero years, and the degree of availability of two technologies (CCS and green hydrogen). Table 3 summarises the sixteen scenarios.

The scenarios generated by the model demonstrate how five key sectors—power, transport, industrial, building, and refinery—would need to evolve to cumulatively achieve net-zero. Under each scenario, and for each sector, the pathways generated comprise a combination of sectoral interventions. Table 4 highlights the interventions considered for new investment calculations in this issue brief.

	Carbon capture & sto No	rage	Carbon capture & storage Yes
	2030 (peak) – 2050 (ne	t-zero)	2030 (peak) – 2050 (net-zero)
Hydrogen Low	Hydrogen Low 2030 – 2060		2030 – 2060
nydrogen 20w	2040 - 2070		2040 – 2070
	2050 – 2080		2050 – 2080
	2030 – 2050		2030 – 2050
Hydrogen High	2030 – 2060		2030 – 2060
.,	2040 – 2070		2040 – 2070
	2050 – 2080		2050 – 2080

Table 3 The 16 scenarios

Source: CEEW-CEF analysis and compilation based on Chaturvedi, Vaibhav, and Ankur Malyan. 2021. Implications of a net-zero target for India's sectoral energy transitions and climate policy. New Delhi: Council on Energy, Environment and Water.

Note: For purposes of this issue brief, we have evaluated the four scenarios represented in the bottom left quadrant. The rationale: (a) limited visibility at present on commercial viability and costs for CCS technologies; (b) deep decarbonisation will require high hydrogen penetration in the absence of CCS.

	Interventions considered for new investment	Interventions not considered for new investment
Power	 Quantity (units) of power generated by 13 generation types (solar, wind, etc). The supporting transmission and distribution, RE integration network required to supply the electricity. 	
Transport	 Volumes of 6 types (2W, 3W, 4W etc) of vehicles manufactured across EV, H₂ and liquids and associated manufacturing capacities. 	
Industrial	 Volume of H₂ (tonnes) produced for industrial energy (heat and feedstock) and H₂ powered vehicles and associated manufacturing capacities. 	 Peak year for coal use, reduction in its use beyond peak year. Reduction in industrial energy intensity of GDP.
Building		• Reduction in intensity of electricity use with respect to GDP.
Refinery		 Peak year for crude oil consumption, reduction in its use beyond peak year.

Table 4 Sectoral interventions under each net-zero scenario

Source: CEEW-CEF analysis and compilation based on Chaturvedi, Vaibhav, and Ankur Malyan. 2021. Implications of a net-zero target for India's sectoral energy transitions and climate policy. New Delhi: Council on Energy, Environment and Water.

4. From interventions to investments

How do we connect the dots from the required sectoral interventions to the quantum of investment needed to achieve them? Table 5 outlines the approach we used to arrive at our investment sizing assumptions. We provide details of the model-generated interventions considered for new investments under each of the selected scenarios in Annexure 1. Details of investment sizing assumptions, which remain the same across scenarios, are in Annexure 2.

Table 5 Model output & investment sizing assumptions

	Model generated outp	ut	Investment sizing assumptions
	Interventions considered for new investment	Associated interventions	
Power	 Quantity (units) of power generated by 13 generation types (solar, wind, etc). 	 GW capacity for each of the 13 generation types (solar, wind, etc). 	 Investment required per MW capacity for each generation type in constant 2020 USD '000. And the supporting transmission and distribution, RE integration network required to supply the electricity.
Transport	• Volumes of 6 types (2W, 3W, 4W etc) of vehicle sold across EV, H ₂ and liquids.		 Investment required per vehicle type per million manufacturing capacity in constant 2020 USD '000 (Excludes investment in the development of charging infrastructure).
Industrial	 Volume of H₂ (tonnes) produced for industrial energy (heat and feedstock) and H₂ powered vehicles. 		 Investment required per kg of H₂ production capacity in constant 2020 USD '000.

5. Investment sizing

We quantified total investment, investment gap, and investment support (as defined later) for the selected 2070 and the other scenarios. Table 6 provides a sectorwise breakdown until the respective net-zero year under the 2070 and other net-zero scenarios and the reference progress as usual scenario *(until 2070)*. We provide details of total investment at a decade level in Annexure 3. Details of the methodology we used to arrive at our investment gap and investment support figures for the power and industrial sectors are in Annexure 4 and Annexure 5, respectively.

- a) **Total investment**: The total capital that needs to be invested in physical infrastructure to achieve the net-zero scenario.
- b) **Investment gap**: The gap between the total investment and what the banking, NBFC, and capital markets are able to muster.
- c) **Investment support:** The support required to mobilise finance that bridges the investment gap.

	Total inv	vestment	Investm	nent gap	Investment support

Annexure II Investment sizing assumptions

Table A6 Investment sizing assumptions used for the reference and analysed net-zero scenarios

Common assumptions for reference and four net-zero scenarios	2020	2040	2050	2070	2080		
Power (constant 2020 USD 000 per MW)							
Solar ^a	400	280	270	270	270		
Wind ^a	979	903	867	816	816		
Coal (IGCC) ^a	-	1,723	1,723	1,723	1,723		
Nuclear (Gen III)ª	3,851	3,851	3,851	3,851	3,851		
RE integration ^b		51 to 72	63 to 88	63 to 88	63 to 88		
Distribution ^c		USD 64	4/MWh				
Transmission ^d		USD 9	1/MWh				
Mobility (constant 2020 USD million manufacturing ca	pacity cost per	million produc	tion for all tecl	hnologies)			
4W ^e		2	32				
2W ^e		11.	76				
3W ^e		9.9	95				
Bus ^e		39	94				
Truck°	394						
Hydrogen (constant 2020 USD investment required pe	r kg of hydroge	en production o	capacity with a	25 year life)			
Solar-based ^f	29.8	15.3	9.76	9.76	9.76		
Wind-based ^f	42.6	24.3	21.61	21.61	21.61		
Grid-based ^f	15	8.1	4.54	4.54	4.54		

Source: CEEW-CEF analysis and compilation based on Chaturvedi, Vaibhav, and Ankur Malyan. 2021. Implications of a net-zero target for India's sectoral energy transitions and climate policy. New Delhi: Council on Energy, Environment and Water.

Note:

- (a) The per MW cost estimates of solar, wind and coal deployment, nuclear are based on a CEEW-CEF compilation and market research; for hydro, we have used the IIT-Roorkee estimates of costs (IIT-Roorkee, 2015). Costs for all other technologies are also considered, but not depicted above given their relatively minor contribution to investment requirements.
- (b) The integration cost is assumed to be USD 43-63 for 1 KW of solar and USD 60-78 for 1 KW of wind capacity deployed from 2026 onwards.
- (c) The distribution investment requirement assumes an annual investment of INR 0.19/unit based on the gross assets deployed at the national level from 2017 to 2020, based on the PFC report on the performance of state power utilities in 2020 and 2019 (PFC, 2021, 2020, 2021). ((INR 0.19 x 1000)/(73 INR/USD)) x 25 years life = USD 64/MWh.
- (d) The transmission investment requirement is taken to be INR 0.27/unit of electricity supplied annually for the period of analysis. The charge is equivalent to 31 per cent of the transmission charges of the INR 0.85/unit transmission charges in FY20 as per the report, *Analysis of Factors Impacting Retail Tariff and Measures to Address Them*, by the Forum of Regulators. ((INR 0.27 x 1000)/(73 INR/USD)) x 25 years life = USD 91/MWh.
- (e) The EV benchmark investment costs for producing per million vehicles have been derived using the balance sheets of prominent players in the respective segments and the methodology described in the CEEW report, *Financing India's Transition to Electric Vehicles* (Singh, Vaibhav et al. 2020). The fixed costs (including R&D) and the annual production capacity have been used to derive the benchmarks, and the depreciation has been used to approximate the useful life of the assets.
- (f) The investments related to hydrogen are based on estimates as under the CEEW report titled "A Green Hydrogen Economy for India: Policy and Technology Imperatives to Lower Production Cost" (Biswas, Tirtha, Deepak Yadav and Ashish Guhan.2020.). The hydrogen numbers are assumed constant post 2050.

Annexure III Total investment

Note:

a. Total banking/NBFC exposure to the power sector as of March 2020 was estimated to be USD 168 billion (Garg, Shreyas, Rishabh Jain and Gagan Sidhu. 2021). This represents a 8 per cent share of the total loan books of Indian Banks and NBFCs, which was estimated to be USD 2.15 trillion (CRIF High Mark, 2021). Headroom is calculated by applying a 5 per cent annual growth rate to USD 168 billion, and assuming a 6 per cent annual principal repayment factor.
 b. The total corporate domestic bond market stood at USD 452 billion as of March 2021 (Source: CRISIL Yearbook on the Indian Debt Market 2021). To derive

b. The total corporate domestic bond market stood at USD 452 billion as of March 2021 (Source: CRISIL Yearbook on the Indian Debt Market 2021). To derive the power sector's share, we have applied the same 8 per cent share that power sector loans represent of total loan books of Indian Banks and NBFCs. This comes to USD 36 billion, Headroom is calculated by applying a 5 pe cent annual growth rate to USD 36 billion, and assuming a 10 per cent annual principal repayment factor (assumed average remaining life of the loan being refinanced).

c. The base for international bond market flows has been estimated to be USD 10 billion. This is based on 3x of the estimated USD 3.5 billion of international bond capital that flowed into Indian RE from January to June 2021 (Garg, Shreyas, Rishabh Jain and Gagan Sidhu. 2021). Headroom is calculated by applying a 5 per cent annual growth rate to USD 10 billion, and assuming a 10 per cent annual principal repayment factor.

d. Amounts in constant 2020 USD billion.

Note:

a. In the absence of any data pertaining to the share of investments in green H2 and H2 production by electrolysis, we assume the banking and NBFC share in investment needs to be 40 per cent. We also assume that domestic bond and international bond market sources will be able to meet 20 per cent and 10 per cent of the investment needs for H2-related investments.

b. Amounts in constant 2020 USD billion

The authors

Vaibhav Pratap Singh | 😏 @tweetvaibhav1 vaibhav.singh@ceew.in

Vaibhav is a Programme Lead with the CEEW Centre for Energy Finance (CEEW-CEF). His focus is on developing financing pathways to advance the energy transition. Before joining CEEW, he was with the Climate Policy Initiative, where he designed financial instruments. Prior to that, he worked with CARE Ratings, where he oversaw ratings of banks and the NBFC sector.

Gagan Sidhu gagan.sidhu@ceew.in

Gagan is the Director of CEEW-CEF, where his focus is on advancing the energy transition. Before joining CEEW, he was CFO of GMR Renewable Energy, and before that he worked in the investment banking industry across multiple geographic locations, including Tokyo, Singapore, London, and Dubai. Gagan holds a BA (Hons) degree in Economics from Delhi University's Shri Ram College of Commerce, and an MBA from Duke University.

Acknowledgment:	We would like to thank Arjun Dutt, Programme Lead, CEEW-CEF, for his detailed comments on the climate finance methodology. We also extend our appreciation to Dr Vaibhav Chaturvedi, Fellow, CEEW, and Ankur Malyan, Programme Associate, CEEW, for providing detailed suggestions and helping us with the model-generated outputs we used for our analysis. Their valuable inputs shaped our research significantly.
Organisation:	The Council on Energy, Environment and Water (CEEW) is one of Asia's leading not-for- profit policy research institutions. The Council uses data, integrated analysis, and strategic outreach to explain – and change – the use, reuse, and misuse of resources. It prides itself on the independence of its high-quality research, develops partnerships with public and private institutions, and engages with wider public. In 2021, CEEW once again featured extensively across ten categories in the <i>2020 Global Go To Think Tank Index Report</i> . The Council has also been consistently ranked among the world's top climate change think tanks. CEEW is certified as a Great Place To Work [®] . Follow us on Twitter @CEEWIndia for the latest updates.
	The CEEW Centre for Energy Finance (CEEW-CEF) is an initiative of the Council on Energy, Environment and Water (CEEW), one of Asia's leading think tanks. CEF acts as a non-partisan market observer and driver that monitors, develops, tests, and deploys financial solutions to advance the energy transition. It aims to help deepen markets, increase transparency, and attract capital in clean energy sectors in emerging economies. It achieves this by comprehensively tracking, interpreting, and responding to developments in the energy markets while also bridging gaps between governments, industry, and financiers.
